Using Tomcat (a Java Web Server) to Create and Run Web Server Programs Written in ooRexx.

In: *The 2021 (32nd) International RexxLA Symposium*, 07.11.-10.11., Digital, Netherlands.

This version is available at: <https://epub.wu.ac.at/8427/>

Available in ePub<sup>WU</sup>: November 2021

ePub<sup>WU</sup>, the institutional repository of the WU Vienna University of Economics and Business, is provided by the University Library and the IT-Services. The aim is to enable open access to the scholarly output of the WU.

This document is the publisher-created published version. It is a verbatim copy of the publisher version.

# Using Tomcat (a Java Web Server) to Create and Run Web Server Programs Written in ooRexx

2021 – International Rexx Symposium  
Online ("Covid-19")  
November 7th – November 10th 2021

Rony G. Flatscher

# Agenda

- Java based web servers
  - Brief overview
  - Servlets
  - Java server pages (JSP), taglibs
- BSF4ooRexx and Tomcat
  - Setup Tomcat
  - [ScriptTagLibs.jar](#) (javax, jakarta)
  - Nutshell samples
- Roundup, outlook, URLs

# Java Based Web Servers, 1

- Specifications modularized
  - Java based web servers implement these, e.g.
    - Adobe "Cold Fusion", Apache "Tomcat", Caucho "Resin", Eclipse "Glassfish" (formerly Oracle), Eclipse "Jetty", IBM "WebSphere", Oracle "WebLogic" (formerly BEA), Red Hat "WildFly" (formerly JBoss), ...
  - Everything is and needs to be implemented in Java
  - "Servlets"
    - Subclass abstract class "`{javax|jakarta}.servlet.http.HttpServlet`"
    - Therefore small Java programs that serve client requests

# Java Based Web Servers, 2

- "Java Server Pages (JSP)"
  - Java code injected into HTML/XML text
  - Gets rewritten as a Java Servlet and then compiled
    - Repeated if JSP source changes
  - Taglibs – "JSP Tag Libraries"
    - Custom tags in JSPs
    - Java implemented tag handlers
    - Allows extending JSP functionalities
      - E.g. JSP Standard Tag Library (STL) for easing control structures, accessing SQL databases etc.

# Apache Tomcat (<https://tomcat.apache.org>), 1

- Java web server
  - Original reference implementation of specifications (Sun)
  - Open-source, now by Apache Software Foundation (ASF)
  - Can be deployed as a
    - Fully fledged, standalone web server
    - Component in complex web server configurations
      - E.g. in Apache [httpd](#), [NINGX](#)
- Flexible installations
  - Configurable at various levels in a "cascading" manner
  - Deploying/removing web applications without restart, ...

# Apache Tomcat (<https://tomcat.apache.org>), 2

- Tomcat modules
  - "Catalina"
    - Servlet container component that implements and hosts the servlet and Java server pages specifications and manages users defined in "realms"
  - "Jasper"
    - JSP component to manage tag libraries, compile and recompile JSPs
  - "Coyote"
    - Connector component that allows access via http, making Tomcat effectively a web server

# Apache Tomcat (<https://tomcat.apache.org>), 3

- Tomcat directory layout (in `CATALINA_HOME`)
  - "`bin`": start, stop Tomcat from commandline
  - "`conf`": Tomcat configuration files like `server.xml`, `config.xml`, `tomcat-users.xml`
  - "`lib`": jar files available to all deployed web applications
  - "`logs`", "`temp`", "`work`": log files, temporary and work directories
  - "`webapps`": root for "web applications" and "web application archives" (`war`) files
    - Copying a `xyz.war` file deploys (and explodes) the web application "`xyz`"
    - Deleting a `xyz.war` file undeploys (and deletes) the web application "`xyz`"
    - Predefined web apps (subdirectories): "`docs`" (Tomcat documentation), "`manager`" (Tomcat manager, must be enabled see URL section), "`ROOT`" (default web app)

# Apache Tomcat (<https://tomcat.apache.org>), 4

- Web application archive (war)
  - A zip/jar (Java archive) file that includes all resources for the application
    - "[xyz.war](#)": "[xyz](#)" name of the web application (url: "<http://server/xyz>")
    - Deployment will explode the archive into the subdirectory named "[xyz](#)"
  - Any files and subdirectories that constitute the web application
    - File "[index.html](#)", optional, returned by default if browsing "<http://server/xyz>"
    - Directory "[WEB-INF](#)", optional may contain
      - The file "[web.xml](#)" (title, configuration, additional resource definitions),
      - The directory "[classes](#)" (web app specific Java classes),
      - The directory "[lib](#)" (web app specific jar files), taglib definitions, ...
    - Directory "[META-INF](#)", optional may contain
      - The file "[config.xml](#)" (web app related configurations)

# Apache Tomcat (<https://tomcat.apache.org>), 5

- "Java EE" vs. "Jakarta EE"
  - Oracle insists on using exclusively the top level name **javax**
    - Approached the open-source community
    - Eclipse foundation new owner of "EE" specifications uses the top level name **jakarta**
      - All specifications and Java class libraries need to be changed! :-)
  - Hence, up to and including *Tomcat 9* ("Java EE") use
    - **javax**.ScriptTagLibs.jar
  - *Tomcat 10 or later* ("Jakarta EE") use
    - **jakarta**.ScriptTagLibs.jar

- Apache httpd (<https://httpd.apache.org/>)
  - "Classic" web server, for decades leading the pack
  - Implemented in C, C++
  - CGI (common gateway interface)
    - Each client request served in a proper process, rather expensive
    - Communicating request information via environment variables
    - ooRexx can be used out of the box
  - Apache httpd *modules*
    - Each client request served in a thread, quite efficient
    - Allows processing each Apache stage in request and response

- Java based web servers
  - No support for non-Java programming languages like ooRexx
  - To empower WU students to create web server programs a tag library was created by the author (summer of 2020): [ScriptTagLibs.jar](#)
    - Tag library to add two tags to JSPs for supporting script languages
      - Tags "[script](#)" and "[expr](#)"
      - Supporting Apache BSF and Java's newer [javax.script](#) framework
    - Allows ooRexx to be used for creating
      - "Rexx Servlets" (scripts always get the Servlet arguments supplied)
      - RSPs ("Rexx server pages")
    - Can be used for *any* script language that implements [javax.script](#) (a.k.a. "[JSR-223](#)", Java specification request # 223)

# BSF4ooRexx and Tomcat

## Setup Tomcat

- Make *BSF4ooRexx* and the *ScriptTagLibs.jar* available to all Tomcat web applications
  - Tomcat, any version
    - Copy `bsf4ooRexx-v641-20210516-bin.jar` (or newer) to `CATALINA_HOME/lib`
  - Tomcat 9 or earlier (Java EE)
    - Copy `javax.ScriptTagLibs.jar` to `CATALINA_HOME/lib`
  - Tomcat 10 or later (Jakarta EE)
    - Copy `jakarta.ScriptTagLibs.jar` to `CATALINA_HOME/lib`

# BSF4ooRexx, Nutshell Example, Code

## "rexxla\_03\_ScriptTagLib/helloworld-jsr223-01.jsp"

```
<%@ page session="false" pageEncoding="ISO-8859-1" contentType="text/html; charset=ISO-8859-1" %>
<%@ taglib uri="http://rexxla.org/taglibs/jsr223" prefix="s" %>

<!DOCTYPE html>
<html>

<head>
  <meta http-equiv="Content-Type" content="text/html; charset=ISO-8859-1">
  <title>Minimal ScriptTagLibs-JSP</title>
</head>

<body>
  <s:script type="rex" >
    use arg request
    say "<h1>Hello, world (ScriptTagLibs JSP)</h1>"
    say "<p>This JSP was executed, because of the following URL:"
    say "<ul><li>URL <em>request~getRequestURL()</em>: <br>"
    say "<code>"request~getRequestURL~toString"</code>"
    say "<li>its URI being <em>request~getRequestURI()</em>: <br>"
    say "<code>"request~getRequestURI"</code></ul></p>"
  </s:script>
</body>
</html>
```

Explained in detail in article:

<https://www.rexxla.org/events/2020/presentations/202011-ooRexxAndJavaWebServers-article.pdf>

# BSF4ooRexx, Nutshell Example, Result

## "rexxla\_03\_ScriptTagLib/helloworld-jsr223-01.jsp"

Code snippet from:

<https://www.rexxla.org/events/2020/presentations/202011-ooRexxAndJavaWebServers-article-code.zip>

Explained in detail in article:

<https://www.rexxla.org/events/2020/presentations/202011-ooRexxAndJavaWebServers-article.pdf>

- Web applications (see URL section)
  - Can be downloaded from the *ScriptTagLibs* BSF4ooRexx project page (see URL section)
  - Web application "[demoRexx.war](#)"
    - Exploded in [CATALINA\\_HOME/webapps/demoRexx](#)
    - Demonstrates ooRexx nutshells and Tomcat
    - Contains a few ooRexx utilities
  - Web application "[demoSTL-Core-SQL\\_ooRexx.war](#)"
    - Exploded in [CATALINA\\_HOME/webapps/demoSTL-Core-SQL\\_ooRexx](#)
      - Demonstrates SQL STL, using SQL from web app, CGI with Tomcat

- Live demonstration of (BSF4)ooRexx web applications

...

- Java web servers, Servlets, JSPs
- "ScriptTagLibs"
  - *javax.ScriptTagLibs.jar*, *jakarta.ScriptTagLibs.jar*
- BSF4ooRexx & ScriptTagLibs with Apache Tomcat
  - Use ooRexx instead of Java in JSPs, hence "RSPs" ;-)
  - Possible to create ooRexx "servlet" programs
    - Each script gets the "request", "response" and "out" objects as arguments (in that order)
- WU students can create (BSF4)ooRexx web server applications !
  - And anyone else ...
